HOW IT WORKS

Retrieval-Augmented Generation

A language model that looks things up in your documents before it answers.

A / INDEX YOUR KNOWLEDGE / DONE AHEAD OF TIME

WHAT GETS STORED

Each chunk is saved three ways: its text, its embedding vector, and the ID of the source it came from.

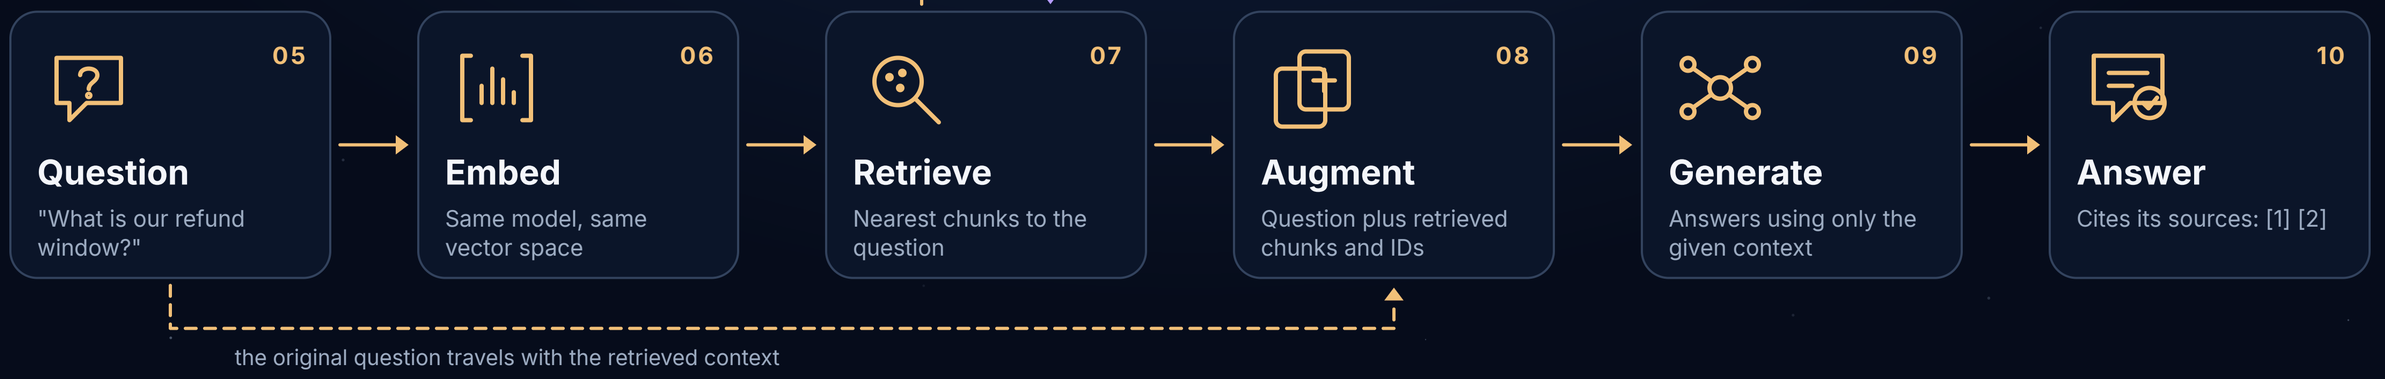

WHY RETRIEVE FIRST

The model answers from your documents, not only from its training, and can point to where each fact came from.

HOW RETRIEVAL WORKS

The question becomes a vector. The store returns the k chunks whose vectors sit nearest to it; k is a setting you choose.

B / ANSWER A QUESTION / EVERY TIME SOMEONE ASKS

INDEX ONCE / RETRIEVE / AUGMENT / GENERATE

XYZ LAYOUT ENGINE

Conceptual diagram: real systems differ in chunk size, embedding model, store and ranking. Icons are hand-drawn vector art; no images were generated.
